Homepage Challenge

Task

Recreate the **complete homepage** of Shahrzad:

URL: https://web.shahrzadcity.ir/home

Build the application as a production-ready frontend.

Stack

Use:

- Next.js 16
- React
- TypeScript
- Tailwind CSS
- Ant Design
- Zustand
- SWR
- Axios

TypeScript is mandatory.

Requirements

Homepage

Recreate the complete homepage, including its:

- Layout and visual design
- Header and navigation
- Tiles
- Banners
- Footer
- Responsive behavior
- Interactions and states
- Motions and animations

Use **IconSax** for icons. (https://iconsax-react.pages.dev/)

Use an appropriate font. You may investigate the reference application and its available resources.

Data & Behavior

A mock backend server should be used. it was provided in the technical interview.

The application must use the provided backend and reproduce the required homepage behavior.

The reference application may contain information and behavior that is not explicitly documented here. **You are expected to investigate and determine what is required.**

Quality

The result should be suitable for production.

Pay attention to:

- Performance
- SEO
- Responsive design
- Type safety
- Maintainability
- Error and loading states
- Testing

Docker

Provide a `Dockerfile` that allows us to build and run the application in an isolated environment.

Do not include secrets in the image.

AI

AI coding tools are allowed.

You are responsible for the submitted code and should be able to explain your implementation and technical decisions.

Mention the AI tools you used and how you used them in the README. It would be nice to explain the whole process you went into.

Submission

Provide a Git repository containing:

- Source code
- `Dockerfile`
- `.env.example`, if required

- `README.md`

The README should briefly describe how to run the project locally and with Docker, required environment variables, and any important decisions or limitations.

Evaluation

We will evaluate:

Visual fidelity · Functionality · Architecture · TypeScript · Performance · SEO · Docker · Engineering judgment

The assignment intentionally does not provide implementation instructions. **Explore the reference application, understand its behavior, and decide how to reproduce it.**
